Mass media-based social marketing campaigns for physical activity

Key messages

- Mass media campaigns do not work when implemented in isolation.
- To be effective, they must form part of an integrated strategy along with policy actions, programs, services, products and environments. This is called a ‘mass media-based social marketing campaign’.
- Mass media-based social marketing campaigns, properly implemented, are one of the best buys for the promotion of physical activity.

What does a ‘mass media-based social marketing campaign’ for physical activity look like?

Mass media campaigns should be designed as one part of a broad social marketing strategy, encompassing complementary policy and environmental changes as well as a promotional/communication component.

1. Relatively large audience within a defined community or population
2. Can be used for agenda-setting, to shift social norms, signpost potential change options or information-seeking steps
3. Greater chance of success when the targeted behaviour is simplified or one-off rather than complex or long-term
4. Diffusion process typically begins slowly but accelerates when 15–25% of the target audience adopts the behaviour change/preventive innovation

1. Involve intervention(s) to change health-related behaviour that provide adequate social value to justify efforts required for the person to change their behaviour
2. Target specific group(s) and segments audience based on particular characteristics
3. Are guided by behaviour change theory
4. Employ a mix of methods for development and implementation, including the 4Ps of marketing (Product, Price, Place, Promotion)

Summary: Mass media-based social marketing campaigns for physical activity
How do I develop a mass media-based social marketing campaign for physical activity?

In adequately resourced settings, the FLOWPROOF protocol should be followed for best practice. Where FLOWPROOF cannot be followed, consider whether investments are better directed towards other actions that can be fully funded (rather than risk underinvestment and marginal impact). Otherwise, following the PRAGMMATIC framework in this scenario can help maximise use and availability of campaign resources and optimise impact.

Adequately resourced settings

- Level of investment likely comparable to annual investment standard recommended for tobacco control (i.e. USD$3.10 per capita for state-wide campaigns)
- Meeting this investment standard in a NSW adult population would require annual investment ~AUD$6m
- Follow the FLOWPROOF protocol for best practice (see Figure 26 in Getting Australia Active III)

Low resource settings

- Low resource means less than optimal financial, human or other campaign resources and/or very rapid timing between commissioning and delivery of a modestly funded campaign
- For these situations, use the PRAGMMATIC framework (see Figure 27 in Getting Australia Active III)

Getting Australia Active III (GAA III) is an Australian guide for policy makers to support the implementation of a whole-of-systems approach to increasing population physical activity. This policy brief summarises key points from Chapter 3.5 of this guide. For more detailed guidance and supporting evidence, you can access the full report at: preventioncentre.org.au

Funding for this research has been provided from the Australian Government’s Medical Research Future Fund (MRFF). The MRFF provides funding to support health and medical research and innovation, with the objective of improving the health and wellbeing of Australians. MRFF funding has been provided to The Australian Prevention Partnership Centre under the MRFF Boosting Preventive Health Research Program. Further information on the MRFF is available at www.health.gov.au/mrff
